📁 4: File Sharing in Windows Server

✅ Tasks

1.

On your Windows Server VM, create a new folder named 'MusicShare' on the D: drive and share it with the network using the Share Wizard.

📝 **Answer:**

Steps:

1. Open **File Explorer**.
2. Open the `D:` drive.
3. Create a new folder named `MusicShare`.
4. Right-click the folder and select **Properties**.
5. Open the **Sharing** tab.
6. Click **Share** to open the sharing wizard.
7. Select the required users or group and click **Share**.
8. Click **Done**.

🎯 **Result:** The `MusicShare` folder was created on the D: drive and shared over the network.

2.

Set NTFS permissions on the 'MusicShare' folder so that the user 'Student1' has Read & Write access, while 'Student2' has Read-only access.

📝 **Answer:**

Steps:

1. Right-click `MusicShare` and select **Properties**.
2. Open the **Security** tab.
3. Click **Edit** → **Add**.
4. Enter `Student1` and click **Check Names** → **OK**.
5. Select `Student1` and allow **Modify**. This provides read and write access.
6. Click **Add** again.
7. Enter `Student2` and click **Check Names** → **OK**.
8. Select `Student2` and allow **Read & execute**, **List folder contents**, and **Read** only.

9. Click **Apply → OK**.

🎯 **Result:** `Student1` has read and write access, while `Student2` has read-only access to the folder.

3.

Configure Share permissions for 'MusicShare' so that only members of the 'MusicLovers' group can access the share, and all others are denied.

📝 **Answer:**

Steps:

1. Open `MusicShare` **Properties**.
2. Go to the **Sharing** tab.
3. Click **Advanced Sharing**.
4. Tick **Share this folder**.
5. Click **Permissions**.
6. Remove `Everyone` if it is listed.
7. Click **Add** and enter `MusicLovers`.
8. Click **Check Names → OK**.
9. Allow the required permissions for `MusicLovers`, such as **Change** and **Read**.
10. Click **Apply → OK**.

🎯 **Result:** Share permissions are configured for the `MusicLovers` group.

📌 **Important:** Ensure that only the intended group has share access and that NTFS permissions also allow the required users. Add `Student1` and `Student2` to `MusicLovers` if they need access through this share. Other users should not receive access through other group memberships or inherited permissions.

4.

Simulate these access scenarios: log in as 'Student1' and try to copy a file into 'MusicShare', then log in as 'Student2' and attempt to delete a file from the same folder. Write down what happens in each case and explain why based on the permissions set.

📝 **Answer:**

Scenario 1: Student1 copies a file

1. Log in using the `Student1` account.
2. Open the shared folder using its network path, for example:

```
\\ServerName\MusicShare
```

3. Copy a file and paste it into the folder.

Expected result: The file should copy successfully because `Student1` has Read & Write access, provided the share permissions also allow writing.

Scenario 2: Student2 deletes a file

1. Log in using the `Student2` account.
2. Open the same shared folder.
3. Select a file and try to delete it.

Expected result: The deletion should fail because `Student2` has read-only NTFS permissions and cannot delete files.

🎯 **Result:** `Student1` can copy files, while `Student2` cannot delete files because their permissions are different.

🎉 Conclusion

In this practical, I created and shared the `MusicShare` folder, configured NTFS and Share permissions, and tested access using two user accounts. `Student1` was given read and write access, while `Student2` was given read-only access.

This practical helped me understand how Windows Server controls file access using NTFS and Share permissions.
